

VE1 Electric Vibrator

The VE1 single phase rotary electric vibrator is built for tough applications with high operating loads and hostile environments

Housing is made of aluminum alloy up to size 660 and in ductile cast iron of high mechanical strength for all other frame sizes.

Units are rated continuous duty even at 100% force output.

Smaller models are with the new engineering design of "in-built flange".

Bearings are larger for longer vibrator's life

Single-Phase 3600 RPM

FEATURES

The eccentric weights are easily adjustable so that force output can be varied on all models.

Low noise:
when fixed with a proper mounting to a rigid structure, noise never exceeds 70 dBA.

Low maintenance:
No lubrication - all models come with sealed bearings.

Lifting and safety eyebolts

Steel endcaps. Unlike aluminum endcaps, steel endcaps will not easily crack or leak.

Multiple bolt hole pattern to make it interchangeable with most of the other brands.

Quality control. Both electrical and mechanical components are subjected to strict tests. After assembly each electric vibrator is subject to severe electric and dynamic tests.

CONTROL BOX

Electric vibrators require overload protection following National Electric Code specifications.

There is the option of a control box with ON/OFF switch and RESET push button.

All models come standard with cable and capacitor

APPLICATION INDUSTRIES
